## SAFETY PRECAUTION (This "safety precaution" is applied only in U.S.A.)

1. Before servicing, unplug the power cord to prevent an electric shock.
2. When replacing parts, use only manufacturer's recommended components for safety.
3. Check the condition of the power cord. Replace if wear or damage is evident.
4. After servicing, be sure to restore the lead dress, insulation barriers, insulation papers, shields, etc.
5. Before returning the serviced equipment to the customer, be sure to make the following insulation resistance test to prevent the customer from being exposed to a shock hazard.

### INSULATION RESISTANCE TEST

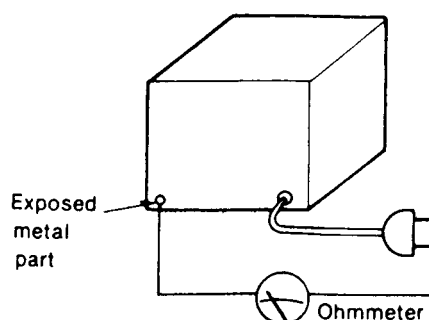

1. Unplug the power cord and short the two prongs of the plug with a jumper wire.
2. Turn on the power switch.
3. Measure the resistance value with ohmmeter between the jumpered AC plug and each exposed metal cabinet part, such as screwheads antenna, control shafts, handle brackets, etc. Equipment with antenna terminals should read between  $3M\Omega$  and  $5.2M\Omega$  to all exposed parts. (Fig. A) Equipment without antenna terminals should read approximately infinity to all exposed parts. (Fig. B)

**Note:** Some exposed parts may be isolated from the chassis by design. These will read infinity.

(Fig. A)

Resistance =  $3M\Omega$ — $5.2M\Omega$

(Fig. B)

Resistance = Approx  $\infty$

4. If the measurement is outside the specified limits, there is a possibility of a shock hazard. The equipment should be repaired and rechecked before it is returned to the customer.

## Adjustment Points

### HEAD AZIMUTH ADJUSTMENT

1. Playback the azimuth adjustment portion (8kHz, -20dB) of the test tape (QZZCFM). Vary the azimuth adjusting screw until the outputs of the L-CH and R-CH are maximized and the lissajous waveform, as illustrated, approaches 0 degrees.

**Note:** If L-CH and R-CH are not maximized at the same point, adjust to the point where the levels of each channel are maximized and equal.

2. Perform the same adjustment in the play mode.
3. After the adjustment, apply screwlock to the azimuth adjusting screw.

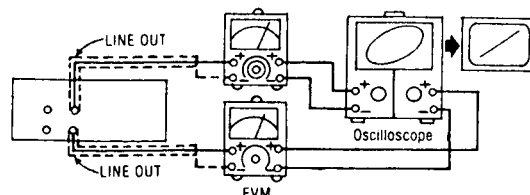

Fig. 1

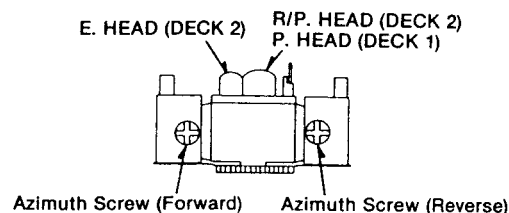

Fig. 2

### TAPE SPEED ADJUSTMENT

#### Normal speed

1. Shift the edit-recording tape-speed selector to "X1".
2. Playback the middle portion of the test tape (QZZCWAT).
3. Adjust Deck 1=VR902 and Deck 2=VR903 so that the output is within the standard value.

#### High speed

4. Shift the edit-recording tape speed switch to "X2".
5. Playback the middle portion of the test tape (QZZCWAT).
6. Adjust Deck 1=VR901 so that the output is within the standard value.

**Note:** The Normal speed adjustment must be done before the high speed adjustment.

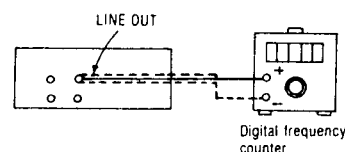

Fig. 3

(DECK 1) Standard value:  $3000 \pm 15$  Hz [Normal (X1)],  $6000 \pm 30$  Hz [High (X2)]  
 (DECK 2) Standard value:  $3000 \pm 15$  Hz [Normal (X1)],  $6000 \pm 600$  Hz [High (X2), only confirmation]

### PLAYBACK GAIN ADJUSTMENT

1. Playback the gain adjusted portion (315Hz, 0dB) of the test tape (QZZCFM).
2. Adjust Deck 1=VR3 (L-CH) [VR4 (R-CH)] and Deck 2=VR5 (L-CH) [VR6 (R-CH)] so that the output is within the standard value.

Standard value:  $0.4V \pm 0.5dB$  ( $126mV \pm 0.5dB$ )

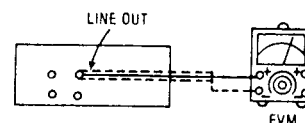

Fig. 4

### PLAYBACK FREQUENCY RESPONSE

1. Playback the frequency response portion (315Hz, 12.5 kHz~63Hz, -20dB) of the test tape (QZZCFM).
2. Assure that the frequency response is within the range shown in Fig. 6 for both L-CH and R-CH.

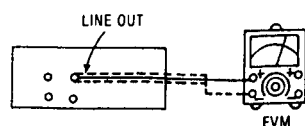

Fig. 5

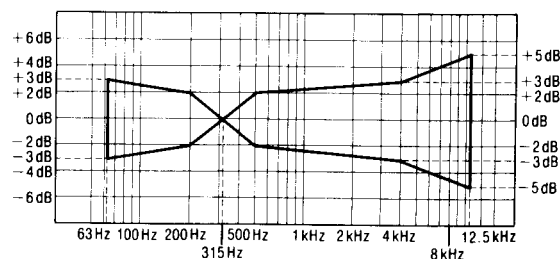

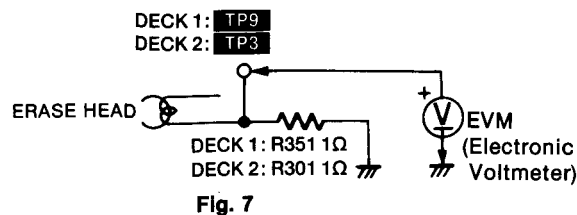

Fig. 6

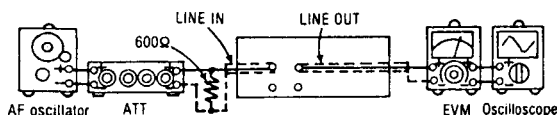

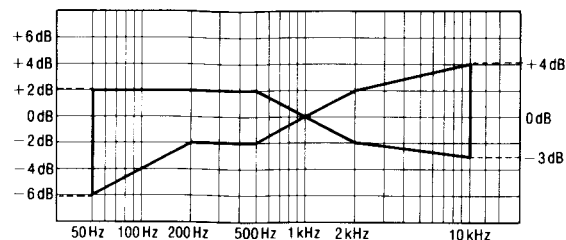

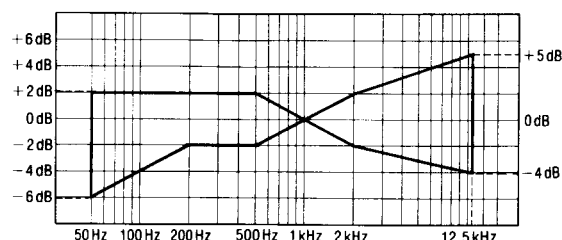

**ERASE CURRENT ADJUSTMENT**

1. Insert the metal blank test tape (QZZCRZ) and set the unit to the record pause mode.
2. Adjust Deck 1=VR351 and Deck 2=VR302 so that the output between Deck 1=TP9 and Deck 2=TP3 and GND is within the standard value.

**Standard value:  $200 \pm 5 \text{ mA (Metal) ... EVM Reading: } 200 \pm 5 \text{ mV}$**

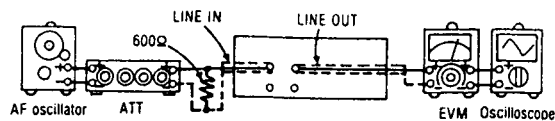

**OVERALL FREQUENCY RESPONSE**

1. Insert the normal blank test tape (QZZCRA) and set the unit to the record pause mode.
2. Apply a reference input signal (1 kHz, -24 dB) through an attenuator.
3. Attenuate the signal by 20 dB and adjust the frequency from 50 Hz ~ 10 kHz.
4. Record the frequency sweep.
5. Playback the recorded signal and assure that it is within the range shown in Fig. 8 in comparison to the reference frequency (1 kHz).
6. If it is not within the standard range, adjust Deck 1=VR353 (L-CH) VR352 (R-CH) and Deck 2=VR303 (L-CH) [VR302 (R-CH)] so that the frequency level is within the standard range.
  - Level up in high frequency range .....Increase the bias current.
  - Level down in high frequency range ...Decrease the bias current.
7. Repeat steps 2~6 above using the CrO<sub>2</sub> tape (QZZCRX) and the metal tape (QZZCRZ) increasing the frequency range to 12.5 kHz (50 Hz ~ 12.5 kHz).
8. Assure that the level is within the range shown in Fig. 9.

**Normal Overall frequency response chart (NR OUT)****CrO<sub>2</sub> Metal Overall frequency response chart (NR OUT)****OVERALL GAIN ADJUSTMENT**

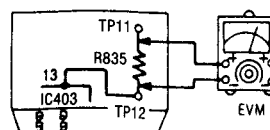

1. Insert the normal blank test tape (QZZCRA) and set the unit to the record pause mode.

3. Record this input signal.
4. Playback the signal recorded in step 3 above, and assure that the output is within the standard value.
5. If it is not within the standard value, adjust Deck 1=VR101 (L-CH) [VR102 (R-CH)] and Deck 2=VR7 (L-CH) [VR8 (R-CH)].
6. Repeat the step 2~5 above until the output is within the standard value.

**Standard value:  $0.4 \text{ V} \pm 0.5 \text{ dB}$**

**dbx TIMING ADJUSTMENT**

1. Shift the noise reduction switch to the dbx position.
2. Playback the gain adjustment portion (315 Hz, 0 dB) of the test tape (QZZCFM).
3. Connect a DC voltmeter across TP11 and TP12.
4. Adjust VR801 so that the output is within the standard value.

**Standard value: DC  $18.4 \text{ mV} \pm 0.5 \text{ mV}$**

## A MAIN CIRCUIT

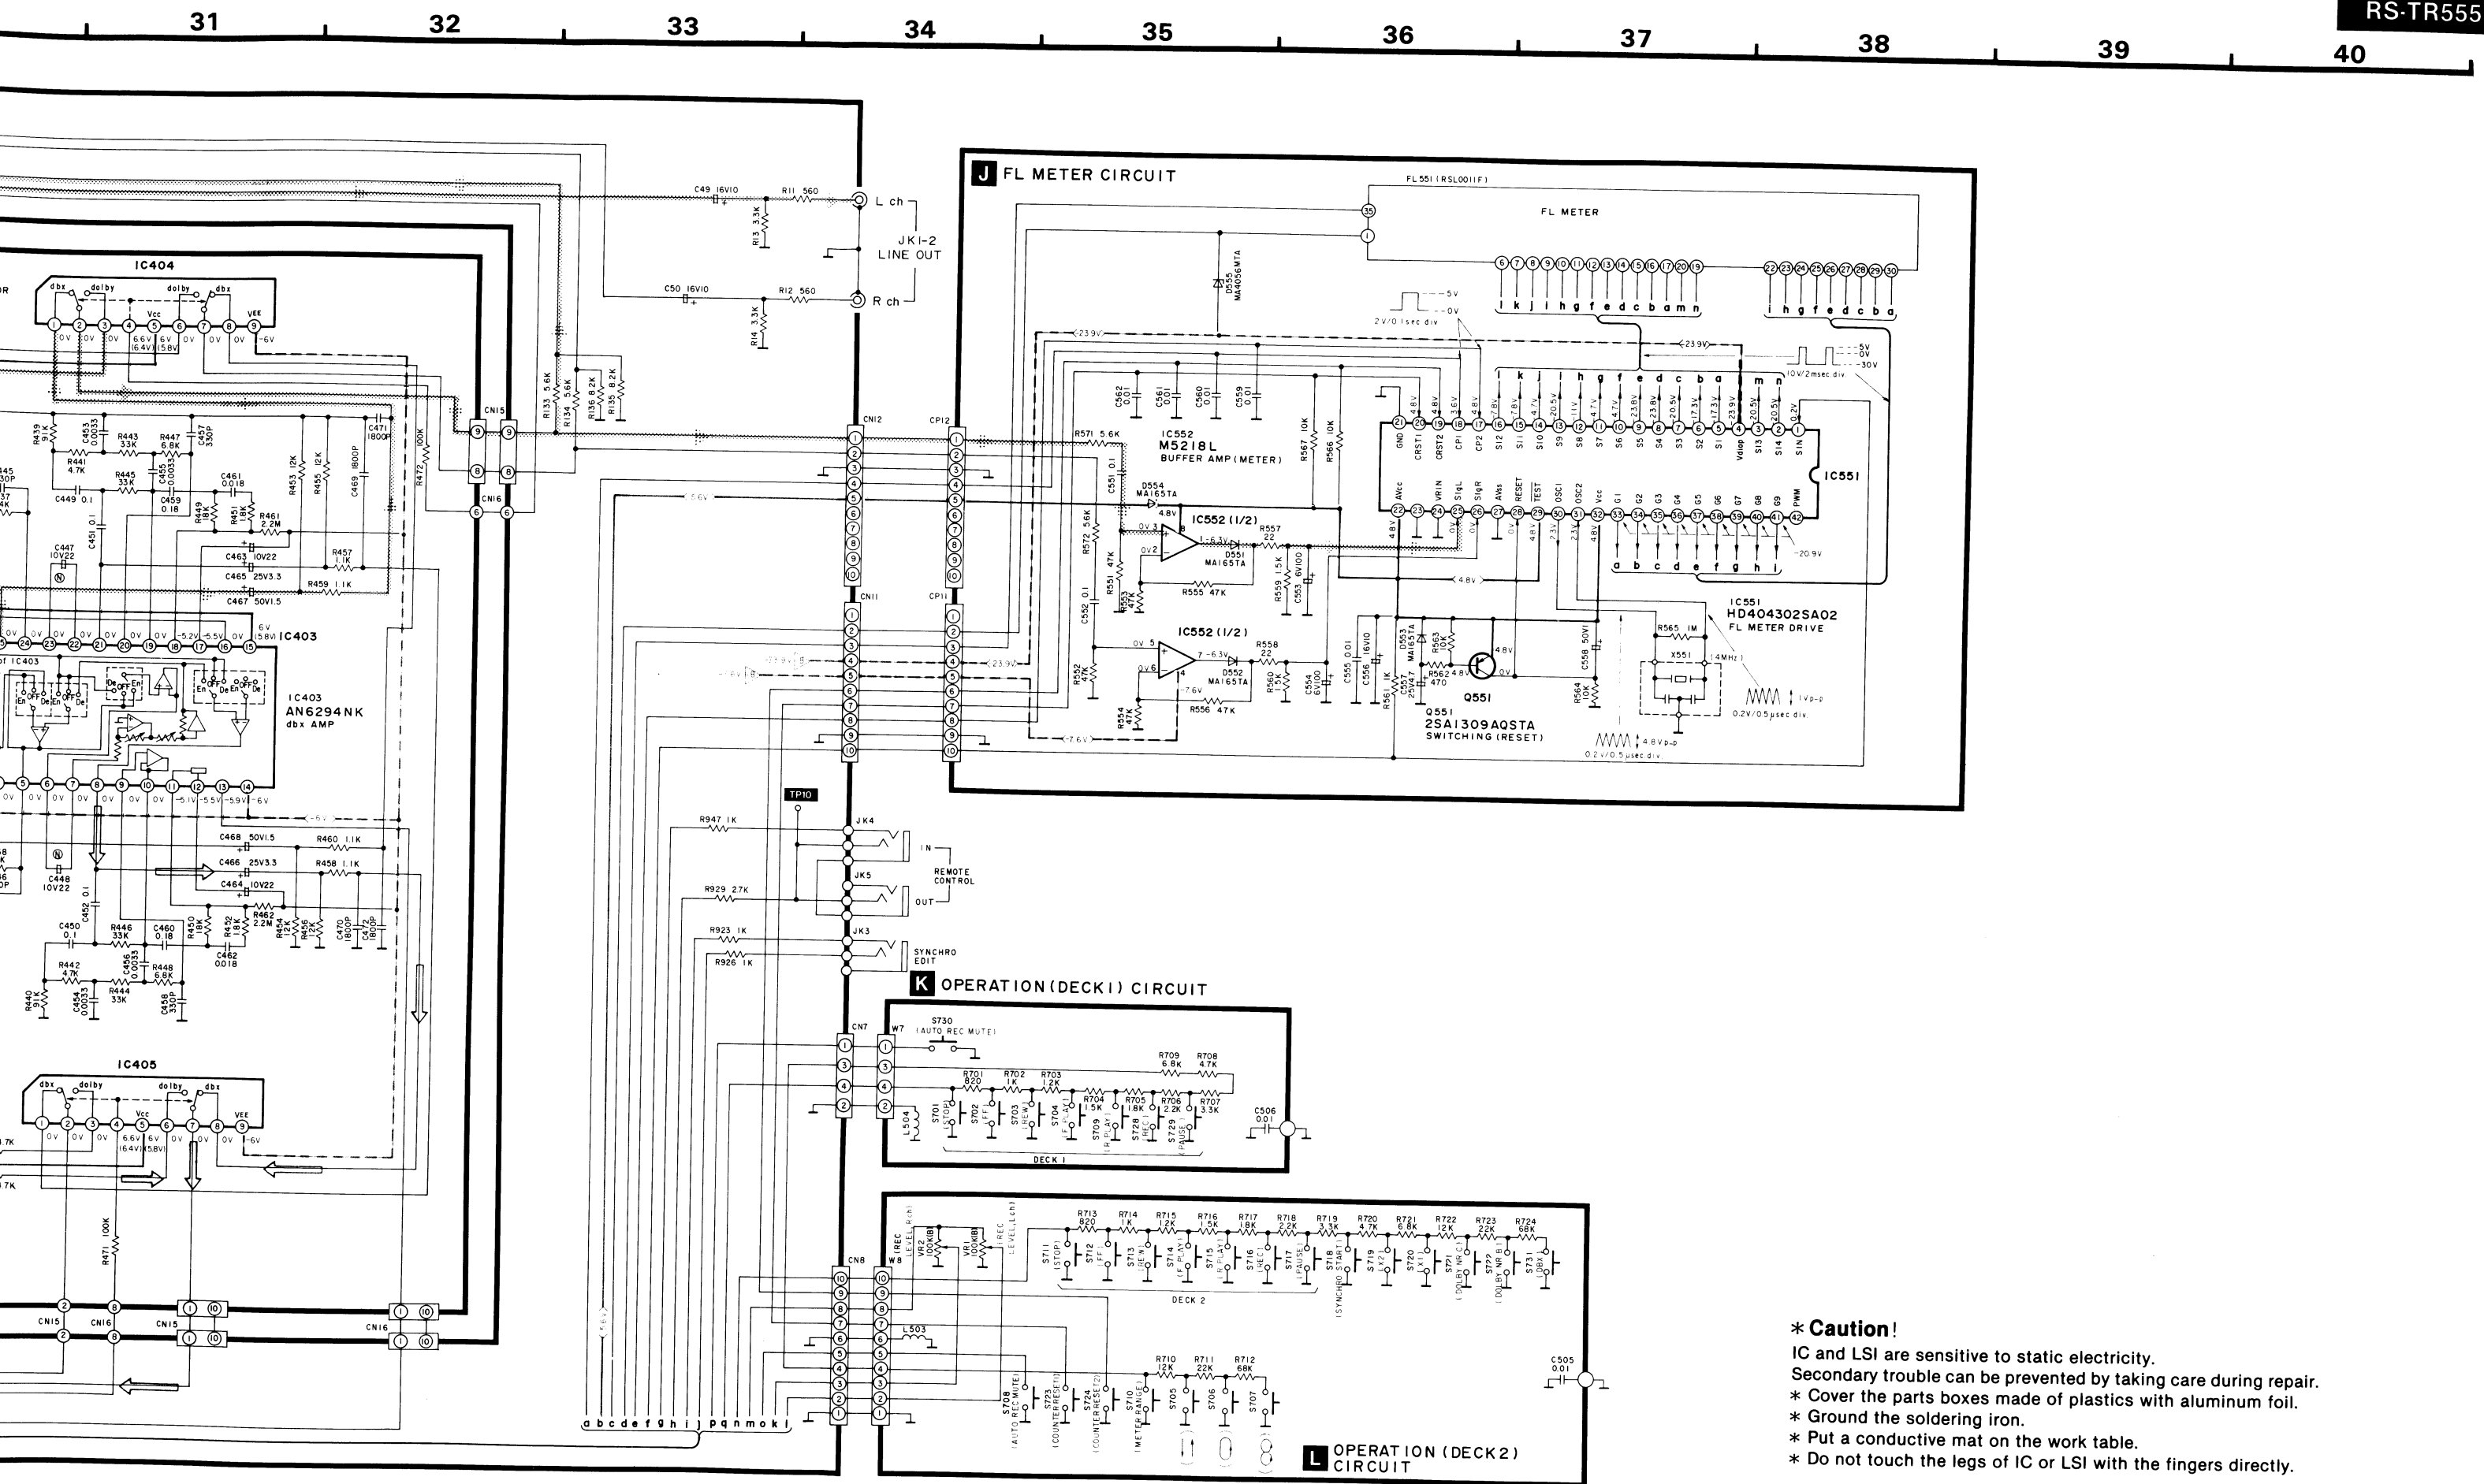

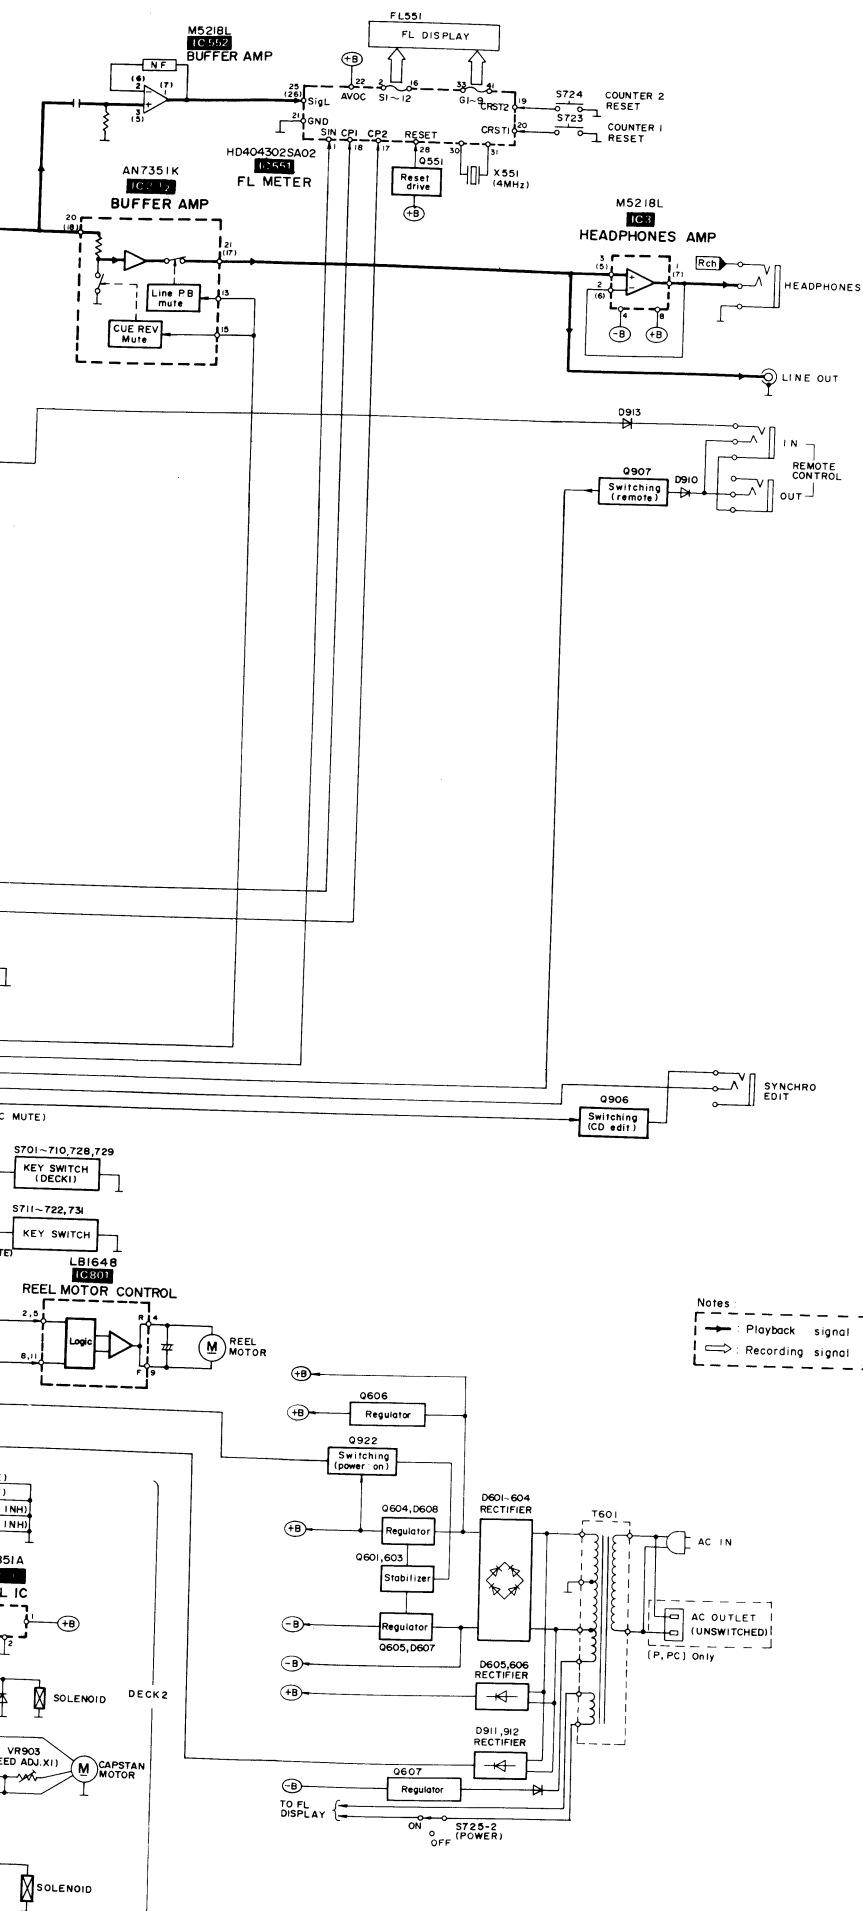

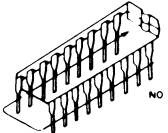

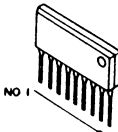

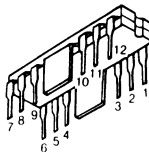

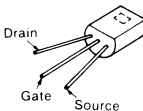

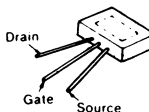

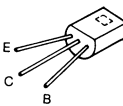

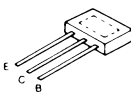

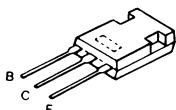

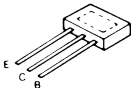

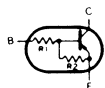

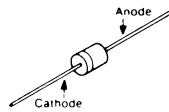

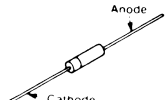

The schematic diagram illustrates the internal circuitry of a stereo cassette deck, organized into several functional blocks:

- DECK 1 & DECK 2:** Each deck has its own set of input/output jacks (R/P HEAD, L ch, R ch) and internal components for tape transport and signal processing.
- ELECTRIC VOLUME:** Controls the volume of the playback signal using a VCA (IC1) and various control lines.
- MUSIC SELECTOR:** Manages the selection of music tracks using a Music Selector Control (IC2) and associated logic.
- REC/PLAYBACK AMP:** Amplifies the recorded signal for playback and provides a pre-amplified signal for recording.
- MUSIC SELECTOR (IC3):** A dedicated IC for managing music selection and track skipping.
- PRE EMPHASIS:** A circuit (IC4) that applies pre-emphasis to the recorded signal to improve high-frequency response.
- BUFFER AMP:** A buffer amplifier (IC5) that isolates the recording signal from the playback signal.
- HEADPHONES AMP:** A dedicated amplifier (IC6) for driving headphones.
- MICROCOMPUTER/MECHANISM:** A central control unit (IC7) that coordinates the operation of the tape transport, motor, and various control functions.
- REEL MOTOR CONTROL:** A section (IC8) that controls the speed and direction of the reel motor.
- POWER SUPPLY:** A section (IC9) that provides the necessary power for the various components, including a power switch and a power filter.

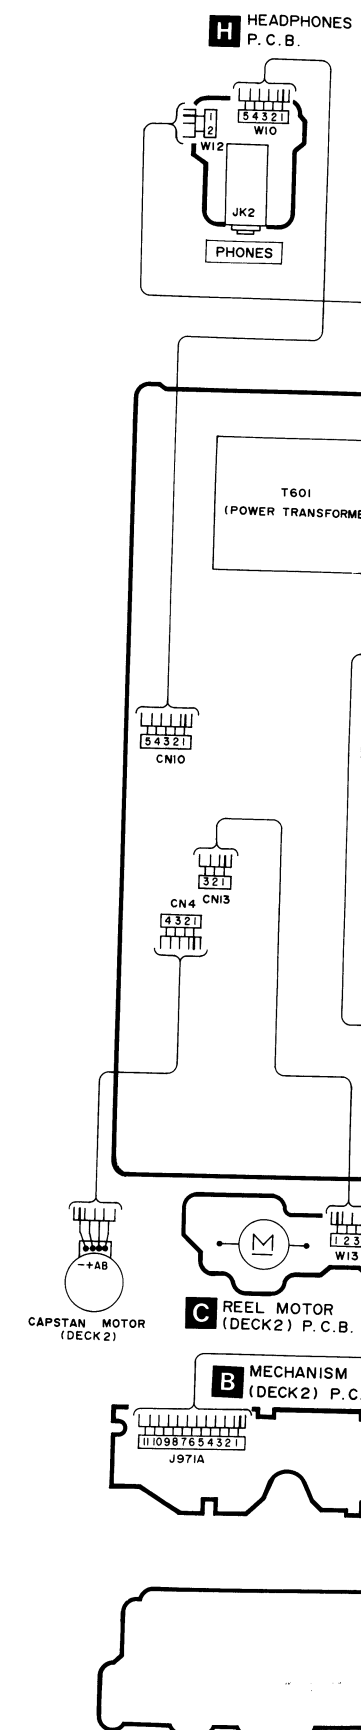

The diagram includes numerous component labels, such as IC1 through IC9, and various control lines (e.g., PLAY, REC, STOP, EJECT). It also features a detailed pinout for the ICs and a list of components (resistors, capacitors, diodes, etc.) used throughout the circuit.
